Acoustic scattering of an incident field f through N packets of obstacles $(y_i + sD_i)_{1 \le i \le N}$ located at $(y_i)_{1 \le i \le N}$:

Motivation: acoustic metamaterials

Figure: Setting of the homogenization problem.

We assume there are N packets of obstacles of size s filling a bounded domain Ω .

$$D_{N,s} = \bigcup_{i=1}^{N} (y_i + sD_i)$$

Sound-absorbing obstacles:

$$\begin{cases} \Delta u_{N,s} + k^2 u_{N,s} = 0 \text{ in } \mathbb{R}^3 \backslash D_{N,s}, \\ u_{N,s} = 0 \text{ on } \partial D_{N,s}, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right) (u_{N,s}(x) - u_{\mathrm{in}}(x)) = O(|x|^{-2}) \text{ as } |x| \to +\infty, \end{cases}$$

High-contrast obstacles:

 $\mathbb{R}^3 \ \kappa,
ho$

 $\delta := \frac{\rho_b}{\rho} \to 0.$

High-contrast obstacles:

Motivation: acoustic metamaterials

Figure: Setting of the homogenization problem.

We assume there are N packets of obstacles of size s filling a bounded domain Ω .

$$D_{N,s} = \bigcup_{i=1}^{N} (y_i + sD_i)$$

Motivation: acoustic metamaterials

Figure: Setting of the homogenization problem.

We assume there are N packets of obstacles of size s filling a bounded domain Ω .

$$D_{N,s} = \bigcup_{i=1}^{N} (y_i + sD_i)$$

The asymptotic analysis is performed with $s \rightarrow 0$, $N \rightarrow +\infty$, $\delta \rightarrow 0$.

Our contribution: randomly distributed centers, quantitative error bounds in $L^2(B(0, R))$ for any R > 0 even close to the obstacles.

Assumption 1

 $(y_i)_{1 \leq i \leq N}$ are distributed randomly and independently according to ρdx with $\rho \in L^{\infty}(\Omega)$ supported in $\Omega \subset \mathbb{R}^3$. In particular, $\rho \geq 0$ and $\int_{\Omega} \rho dx = 1$, and

 $\sum_{i=1}^{N} \delta_{y_i} \to \rho dx \text{ as } N \to +\infty, \text{ in the sense of distributions.}$

Assumption 1

 $(y_i)_{1 \le i \le N}$ are distributed randomly and independently according to ρdx with $\rho \in L^{\infty}(\Omega)$ supported in $\Omega \subset \mathbb{R}^3$. In particular, $\rho \ge 0$ and $\int_{\Omega} \rho dx = 1$, and $\sum_{i=1}^{N} \delta_{y_i} \to \rho dx$ as $N \to +\infty$, in the sense of distributions.

Assumption 2

The packets of resonators are identical and constituted of K single components $(B_l)_{1 \le l \le K}$:

$$D_i = D := \bigcup_{l=1}^{\kappa} B_l, \qquad \forall 1 \le i \le N.$$

For sound-absorbing metamaterials, we assume further the subcritical regime sN = O(1): Assumption 3

There exists a constant c > 0 such that the parameters s and N satisfy

 $sN \leq c$.

Assume assumptions 1, 2 and 3 and denote by u the solution to the Lippmann-Schwinger equation

$$\begin{cases} \Delta u + (k^2 - sN \operatorname{cap}(D)\rho \mathbf{1}_{\Omega})u = 0 \ in \ \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_{\mathrm{in}}) = O(|x|^{-2}) \ \text{as } |x| \to +\infty. \end{cases}$$
(1)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, the function u is an approximation of the total wave field $u_{N,s}$ with the following error estimates:

Assume assumptions 1, 2 and 3 and denote by u the solution to the Lippmann-Schwinger equation

$$\begin{cases} \Delta u + (k^2 - sN \operatorname{cap}(D)\rho \mathbf{1}_{\Omega})u = 0 \ in \ \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_{\mathrm{in}}) = O(|x|^{-2}) \ \text{as } |x| \to +\infty. \end{cases}$$
(1)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, the function u is an approximation of the total wave field $u_{N,s}$ with the following error estimates:

1. on any ball B(0, r) containing the obstacles, $\Omega \subset B(0, r)$ and for any $N \ge N_0$:

$$\mathbb{E}[||u_{N,s} - u||^{2}_{L^{2}(B(0,r))}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \le csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}});$$
(2)

Assume assumptions 1, 2 and 3 and denote by u the solution to the Lippmann-Schwinger equation

$$\begin{cases} \Delta u + (k^2 - sN \operatorname{cap}(D)\rho \mathbf{1}_{\Omega})u = 0 \ in \ \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_{\mathrm{in}}) = O(|x|^{-2}) \ \text{as } |x| \to +\infty. \end{cases}$$
(1)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, the function u is an approximation of the total wave field $u_{N,s}$ with the following error estimates:

1. on any ball B(0,r) containing the obstacles, $\Omega \subset B(0,r)$ and for any $N \ge N_0$:

$$\mathbb{E}[||u_{N,s} - u||^{2}_{L^{2}(B(0,r))}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}});$$
(2)

2. on any bounded open subset $A \subset \mathbb{R}^3 \setminus \Omega$ away from the obstacles and for any $N \ge N_0$:

$$\mathbb{E}[||\nabla u_{N,s} - \nabla u||_{L^{2}(\mathcal{A})}^{2}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}}).$$
(3)

Assume assumptions 1, 2 and 3 and denote by u the solution to the Lippmann-Schwinger equation

$$\begin{cases} \Delta u + (k^2 - sN \operatorname{cap}(D)\rho \mathbf{1}_{\Omega})u = 0 \ in \ \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_{\mathrm{in}}) = O(|x|^{-2}) \ \text{as } |x| \to +\infty. \end{cases}$$
(1)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, the function u is an approximation of the total wave field $u_{N,s}$ with the following error estimates:

1. on any ball B(0, r) containing the obstacles, $\Omega \subset B(0, r)$ and for any $N \ge N_0$:

$$\mathbb{E}[||u_{N,s} - u||^{2}_{L^{2}(B(0,r))}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}});$$
(2)

2. on any bounded open subset $A \subset \mathbb{R}^3 \setminus \Omega$ away from the obstacles and for any $N \ge N_0$:

$$\mathbb{E}[||\nabla u_{N,s} - \nabla u||_{L^{2}(\mathcal{A})}^{2}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}}).$$
(3)

The relative error is of order $O(\max((sN)^2 N^{-\frac{1}{3}}, N^{-\frac{1}{2}}))$ because the scattered fields $u_{N,s} - u_{in}$ and $u - u_{in}$ are of order O(sN).

Sound-absorbing metamaterials

1. For sN \to 0, the effective medium is transparent, i.e. $u_{N,s}\to u_{\rm in}$ where $\Delta u_{\rm in}+k^2u_{\rm in}=0$

Sound-absorbing metamaterials

- 1. For $sN \to 0$, the effective medium is transparent, i.e. $u_{N,s} \to u_{\rm in}$ where $\Delta u_{\rm in} + k^2 u_{\rm in} = 0$
- 2. For $sN \to \Lambda$ with $\Lambda > 0$, the effective medium is dissipative, $u_{N,s} \to u$, the solution to the Helmholtz equation with "strange term"

$$\begin{cases} \Delta u + (k^2 - \Lambda \mathrm{cap}\,(D)\rho \mathbf{1}_{\Omega})u = 0 \text{ in } \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_\mathrm{in}) = O(|x|^{-2}) \text{ as } |x| \to +\infty \end{cases}$$

- 1. For $sN \to 0$, the effective medium is transparent, i.e. $u_{N,s} \to u_{\rm in}$ where $\Delta u_{\rm in} + k^2 u_{\rm in} = 0$
- 2. For $sN \to \Lambda$ with $\Lambda > 0$, the effective medium is dissipative, $u_{N,s} \to u$, the solution to the Helmholtz equation with "strange term"

$$\begin{cases} \Delta u + (k^2 - \Lambda \mathrm{cap}\,(D)\rho \mathbf{1}_\Omega) u = 0 \,\,\mathrm{in}\,\,\mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right) (u - u_\mathrm{in}) = O(|x|^{-2}) \,\,\mathrm{as}\,\,|x| \to +\infty \end{cases}$$

3. For $sN \to +\infty$, we expect that the obstacles "solidify" in a single sound-hard obstacle Ω , and that $u_{N,s} \to u$ where u is the solution to the problem

$$\begin{cases} \Delta u + k^2 u = 0 \text{ in } \mathbb{R}^3, \\ u = 0 \text{ on } \Omega, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right) (u - u_{\mathrm{in}}) = O(|x|^{-2}) \text{ as } |x| \to +\infty. \end{cases}$$

However this would require a significantly different analysis.

- 1. Exposition of the results for sound-absorbing materials
- 2. Exposition of the results for high-contrast metamaterials
- 3. Main ingredients of the proof: layer potentials and convergence of a Foldy-Lax system.

High-contrast metamaterials feature resonances. Denote by $(\mathbf{a}_k)_{1 \le k \le K}$ and $0 < \lambda_1 \le \lambda_2 \le \ldots \le \lambda_K$ the eigenvectors and eigenvalues of the generalized eigenvalue problem

$$C\mathbf{a}_{j} = \lambda_{j} V \mathbf{a}_{j} \text{ with } C := \left(-\int_{\partial B_{j}} \mathcal{S}_{D}^{-1}[1_{\partial B_{j}}] \mathrm{d}\sigma \right)_{1 \leq i, j \leq K} \text{ and } V := \mathrm{diag}(|B_{i}|)_{1 \leq i \leq K}, \quad (4)$$

Figure: Setting of the homogenization problem.

We assume there are N packets of obstacles of size s filling a bounded domain Ω .

$$D_{N,s} = \bigcup_{i=1}^{N} (y_i + sD_i)$$

High-contrast metamaterials feature resonances. Denote by $(\mathbf{a}_k)_{1 \le k \le K}$ and $0 < \lambda_1 \le \lambda_2 \le \ldots \le \lambda_K$ the eigenvectors and eigenvalues of the generalized eigenvalue problem

$$C\mathbf{a}_{j} = \lambda_{j} V \mathbf{a}_{j} \text{ with } C := \left(-\int_{\partial B_{j}} \mathcal{S}_{D}^{-1}[1_{\partial B_{j}}] \mathrm{d}\sigma \right)_{1 \leq i, j \leq K} \text{ and } V := \mathrm{diag}(|B_{i}|)_{1 \leq i \leq K}, \quad (4)$$

High-contrast metamaterials feature resonances. Denote by $(\mathbf{a}_k)_{1 \le k \le K}$ and $0 < \lambda_1 \le \lambda_2 \le \ldots \le \lambda_K$ the eigenvectors and eigenvalues of the generalized eigenvalue problem

$$C\mathbf{a}_{j} = \lambda_{j} V \mathbf{a}_{j} \text{ with } C := \left(-\int_{\partial B_{j}} \mathcal{S}_{D}^{-1}[1_{\partial B_{j}}] \mathrm{d}\sigma \right)_{1 \leq i, j \leq K} \text{ and } V := \mathrm{diag}(|B_{i}|)_{1 \leq i \leq K}, \quad (4)$$

The metamaterial constituted of N identical packets of K connected resonators $sD = \bigcup_{i=1}^{K} sB_i$ admits K resonant frequencies

$$\omega_i(\delta, s) = \frac{\delta^{\frac{1}{2}}}{s} \lambda_i^{\frac{1}{2}} v_b \text{ with } v_b := \sqrt{\frac{\rho_b}{\kappa_b}},$$

High-contrast metamaterials feature resonances. Denote by $(\mathbf{a}_k)_{1 \le k \le K}$ and $0 < \lambda_1 \le \lambda_2 \le \ldots \le \lambda_K$ the eigenvectors and eigenvalues of the generalized eigenvalue problem

$$C\mathbf{a}_{j} = \lambda_{j} V \mathbf{a}_{j} \text{ with } C := \left(-\int_{\partial B_{j}} \mathcal{S}_{D}^{-1}[1_{\partial B_{j}}] \mathrm{d}\sigma \right)_{1 \leq i,j \leq K} \text{ and } V := \mathrm{diag}(|B_{i}|)_{1 \leq i \leq K}, \quad (4)$$

The metamaterial constituted of N identical packets of K connected resonators $sD = \bigcup_{i=1}^{K} sB_i$ admits K resonant frequencies

$$\omega_i(\delta, s) = \frac{\delta^{\frac{1}{2}}}{s} \lambda_i^{\frac{1}{2}} v_b \text{ with } v_b := \sqrt{\frac{\rho_b}{\kappa_b}},$$

Since in our analysis ω is fixed but s is variable, it is equivalent to say that there is K resonant sizes

$$s_i(\delta) := rac{\delta^{rac{1}{2}}}{\omega} \lambda_i^{rac{1}{2}} v_b, \qquad 1 \leq i \leq K.$$

High-contrast metamaterials feature resonances. Denote by $(\mathbf{a}_k)_{1 \le k \le K}$ and $0 < \lambda_1 \le \lambda_2 \le \ldots \le \lambda_K$ the eigenvectors and eigenvalues of the generalized eigenvalue problem

$$C\mathbf{a}_{j} = \lambda_{j} V \mathbf{a}_{j} \text{ with } C := \left(-\int_{\partial B_{j}} \mathcal{S}_{D}^{-1}[1_{\partial B_{j}}] \mathrm{d}\sigma
ight)_{1 \leq i, j \leq K} \text{ and } V := \mathrm{diag}(|B_{i}|)_{1 \leq i \leq K}, \quad (4)$$

The metamaterial constituted of N identical packets of K connected resonators $sD = \bigcup_{i=1}^{K} sB_i$ admits K resonant frequencies

$$\omega_i(\delta, s) = \frac{\delta^{\frac{1}{2}}}{s} \lambda_i^{\frac{1}{2}} v_b \text{ with } v_b := \sqrt{\frac{\rho_b}{\kappa_b}},$$

Since in our analysis ω is fixed but s is variable, it is equivalent to say that there is K resonant sizes

$$s_i(\delta) := rac{\delta^{rac{1}{2}}}{\omega} \lambda_i^{rac{1}{2}} \mathsf{v}_b, \qquad 1 \leq i \leq \mathcal{K}.$$

• As $s \to s_i(\delta)$, the relevant "critical quantity" is

$$sNQ(s,\delta)$$
 with $Q(s,\delta) := \sum_{i=1}^{K} \frac{\lambda_i}{\frac{s^2}{s_i(\delta)^2} - 1} (\boldsymbol{a}_i^T V 1)^2$,

where $1 = (1)_{1 \le i \le K}$ is the vector of ones.

For high-contrast metamaterials, we assume the following subcritical regime

Assumption 4

 $\exists 1 \leq i \leq K$, $s \sim s_i(\delta)$ with $\mathbf{a}_i^T V 1 \neq 0$, and there exists c > 0 independent of s, δ and N such that

$$sN|Q(s,\delta)| \le c.$$
 (5)

Note that $|Q(s, \delta)| \to +\infty$ and $sN \to 0$ as $s \sim s_i(\delta)$. This assumption is equivalent to

For high-contrast metamaterials, we assume the following subcritical regime

Assumption 4

 $\exists 1 \leq i \leq K$, $s \sim s_i(\delta)$ with $\mathbf{a}_i^T V 1 \neq 0$, and there exists c > 0 independent of s, δ and N such that

$$sN|Q(s,\delta)| \le c.$$
 (5)

Note that $|Q(s, \delta)| \to +\infty$ and $sN \to 0$ as $s \sim s_i(\delta)$. This assumption is equivalent to Assumption 4

The contrast parameter is strictly smaller than N^{-2} :

$$\delta = o(N^{-2}) \Leftrightarrow \delta^{\frac{1}{2}}N \to 0,$$

and there exists $1 \le i \le K$ such that $s \sim s_i(\delta)$ with $a_i^T V 1 \ne 0$ at a rate slower than $\delta^{\frac{1}{2}} N$:

$$\exists 1 \leq i \leq K, \ c\delta^{\frac{1}{2}}N \leq \left|\frac{s}{s_i(\delta)} - 1\right| \longrightarrow 0 \ as \ \delta \to 0.$$

For high-contrast metamaterials, we assume the following subcritical regime

Assumption 4

 $\exists 1 \leq i \leq K$, $s \sim s_i(\delta)$ with $\mathbf{a}_i^T V \mathbf{1} \neq 0$, and there exists c > 0 independent of s, δ and N such that

$$sN|Q(s,\delta)| \le c.$$
 (5)

Note that $|Q(s, \delta)| \to +\infty$ and $sN \to 0$ as $s \sim s_i(\delta)$. This assumption is equivalent to Assumption 4

The contrast parameter is strictly smaller than N^{-2} :

$$\delta = o(N^{-2}) \Leftrightarrow \delta^{\frac{1}{2}}N \to 0,$$

and there exists $1 \le i \le K$ such that $s \sim s_i(\delta)$ with $a_i^T V 1 \ne 0$ at a rate slower than $\delta^{\frac{1}{2}} N$:

$$\exists 1 \leq i \leq K, \ c \delta^{rac{1}{2}} \textit{N} \leq \left| rac{\textit{s}}{\textit{s}_i(\delta)} - 1 \right| \longrightarrow 0 \ \textit{as} \ \delta
ightarrow 0.$$

Our assumption states that s is close to $s_i(\delta)$ but is not in the interval $(s_i(\delta) - c\delta^{\frac{1}{2}}N, s_i(\delta) + c\delta^{\frac{1}{2}}N)$

For high-contrast metamaterials, we assume the following subcritical regime

Assumption 4

 $\exists 1 \leq i \leq K$, $s \sim s_i(\delta)$ with $\mathbf{a}_i^T V \mathbf{1} \neq 0$, and there exists c > 0 independent of s, δ and N such that

$$sN|Q(s,\delta)| \le c.$$
 (5)

Note that $|Q(s, \delta)| \to +\infty$ and $sN \to 0$ as $s \sim s_i(\delta)$. This assumption is equivalent to Assumption 4

The contrast parameter is strictly smaller than N^{-2} :

$$\delta = o(N^{-2}) \Leftrightarrow \delta^{\frac{1}{2}}N \to 0,$$

and there exists $1 \le i \le K$ such that $s \sim s_i(\delta)$ with $a_i^T V 1 \ne 0$ at a rate slower than $\delta^{\frac{1}{2}} N$:

$$\exists 1 \leq i \leq K, \ c \delta^{rac{1}{2}} \textit{N} \leq \left| rac{\textit{s}}{\textit{s}_i(\delta)} - 1 \right| \longrightarrow 0 \ \textit{as} \ \delta
ightarrow 0.$$

Our assumption states that s is close to $s_i(\delta)$ but is not in the interval $(s_i(\delta) - c\delta^{\frac{1}{2}}N, s_i(\delta) + c\delta^{\frac{1}{2}}N)$

Assume assumptions 1,2 and 4 and denote by u the solution to the following Lippmann-Schwinger equation:

$$\begin{cases} \left(\Delta + k^2 - sNQ(s,\delta)\rho \mathbf{1}_{\Omega}\right) u = 0, \\ \left(\frac{\partial}{\partial|x|} - ik\right) (u - u_{in}) = O(|x|^{-2}) \text{ as } |x| \to +\infty. \end{cases}$$
(6)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, u is an approximation of the solution field $u_{N,s}$ with the following error estimates:

1. on any ball B(0, r) such that $\Omega \subset B(0, r)$ and for any $N \ge N_0$:

$$\mathbb{E}[||u_{N,s} - u||^{2}_{L^{2}(B(0,R))}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csNQ(s,\delta)\max(\delta^{\frac{1}{2}}N, N^{-\frac{1}{2}});$$

Assume assumptions 1,2 and 4 and denote by u the solution to the following Lippmann-Schwinger equation:

- ▶ If $\Lambda < 0$ (s is slightly smaller than the resonant size $s_i(\delta)$, but not too close), then the effective medium is dispersive.
- If sNQ(s, δ) → +∞, we expect that the medium solidifies as for sound-absorbing obstacles. If sNQ(s, δ) → -∞, then the medium becomes highly dispersive. This case remains opened.

- 1. Exposition of the results for sound-absorbing materials
- 2. Exposition of the results for high-contrast metamaterials
- 3. Main ingredients of the proof: layer potentials and convergence of a Foldy-Lax system.

1. the scattered field of a single resonator sD centered at 0 can be written

 $u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

2. the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s\mathrm{cap}\left(D\right)\sum_{1\leq j\neq i\leq N} u_{s,N}(y_j)\Gamma^k(y_i-y_j)$$

Sketch of the derivation

The Foldy-Lax approximation:

1. The scattered field can be approximated by the contribution of N point-sources located at the centers $(y_i)_{1 \le i \le N}$:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s \mathrm{cap}\left(D\right) \sum_{1 \leq j \neq i \leq N} u_{s,N}(y_j) \Gamma^k(y_i - y_j)$$

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

2. the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s\mathrm{cap}\left(D\right)\sum_{1\leq j\neq i\leq N} u_{s,N}(y_j)\Gamma^k(y_i-y_j)$$

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_{\mathrm{s}}(x)\simeq-\mathrm{scap}\left(D
ight)u_{\mathrm{in}}(0)(1+O(\omega)+O(|x|^{-1}))\Gamma^{k}(x)$$

2. the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s\mathrm{cap}\left(D\right)\sum_{1\leq j\neq i\leq N} u_{s,N}(y_j)\Gamma^k(y_i - y_j)$$

3. Assuming that $(y_i)_{i \in \mathbb{N}}$ is randomly and independently distributed according to ρdx , we expect the convergence of $(u_{s,N}(y_i)_{1 \le i \le N})$ to the values $(u(y_i))_{1 \le i \le N}$ where u is the solution to the integral equation:

$$u(y) - u_{\rm in}(y) = -sN{\rm cap}\left(D\right)\int_{\Omega}\Gamma^{k}(y-y')u(y')\rho(y'){\rm d}y'.$$

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

 the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

3. Assuming that $(y_i)_{i \in \mathbb{N}}$ is randomly and independently distributed according to ρdx , we expect the convergence of $(u_{s,N}(y_i)_{1 \le i \le N})$ to the values $(u(y_i))_{1 \le i \le N}$ where u is the solution to the integral equation:

$$u(y) - u_{\rm in}(y) = -sN{\rm cap}\left(D\right)\int_{\Omega}\Gamma^{k}(y-y')u(y')\rho(y'){\rm d}y'.$$

Sketch of the derivation

Proposition 1

Assume assumptions 1, 2 and 3 and denote by u the solution to the Lippmann-Schwinger equation

$$\begin{cases} \Delta u + (k^2 - sN \operatorname{cap}(D)\rho \mathbf{1}_{\Omega})u = 0 \ in \ \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_{\mathrm{in}}) = O(|x|^{-2}) \ \text{as } |x| \to +\infty. \end{cases}$$
(1)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, the function u is an approximation of the total wave field $u_{N,s}$ with the following error estimates:

1. on any ball B(0,r) containing the obstacles, $\Omega \subset B(0,r)$ and for any $N \ge N_0$:

$$\mathbb{E}[||u_{N,s} - u||^{2}_{L^{2}(B(0,r))}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \le csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}});$$
(2)

2. on any bounded open subset $A \subset \mathbb{R}^3 \setminus \Omega$ away from the obstacles and for any $N \ge N_0$:

$$\mathbb{E}[||\nabla u_{N,s} - \nabla u||_{L^{2}(\mathcal{A})}^{2}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}}).$$
(3)

The relative error is of order $O(\max((sN)^2N^{-\frac{1}{3}}, N^{-\frac{1}{2}}))$ because the scattered fields $u_{N,s} - u_{in}$ and $u - u_{in}$ are of order O(sN).

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

 the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s\mathrm{cap}\left(D\right)\sum_{1\leq j\neq i\leq N} u_{s,N}(y_j)\Gamma^k(y_i - y_j)$$

3. Assuming that $(y_i)_{i \in \mathbb{N}}$ is randomly and independently distributed according to ρdx , we expect the convergence of $(u_{s,N}(y_i)_{1 \le i \le N})$ to the values $(u(y_i))_{1 \le i \le N}$ where u is the solution to the integral equation:

$$u(y) - u_{\rm in}(y) = -sN{\rm cap}\left(D\right)\int_{\Omega}\Gamma^{k}(y-y')u(y')\rho(y'){\rm d}y'.$$

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

 the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s\mathrm{cap}\left(D\right)\sum_{1\leq j\neq i\leq N} u_{s,N}(y_j)\Gamma^k(y_i - y_j)$$

3. Assuming that $(y_i)_{i \in \mathbb{N}}$ is randomly and independently distributed according to ρdx , we expect the convergence of $(u_{s,N}(y_i)_{1 \le i \le N})$ to the values $(u(y_i))_{1 \le i \le N}$ where u is the solution to the integral equation:

$$u(y) - u_{\rm in}(y) = -sN_{\rm cap}(D)\int_{\Omega}\Gamma^{k}(y-y')u(y')\rho(y')\mathrm{d}y'.$$

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

2. the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -s\mathrm{cap}\left(D\right)\sum_{1\leq j\neq i\leq N} u_{s,N}(y_j)\Gamma^k(y_i-y_j)$$

Justification with layer potentials

Assuming that (y_i)_{i∈ℕ} is randomly and independently distributed according to ρdx, we expect the convergence of (u_{s,N}(y_i)_{1≤i≤N}) to the values (u(y_i))_{1≤i≤N} where u is the solution to the integral equation:

$$u(y) - u_{\mathrm{in}}(y) = -s \mathcal{N}_{\mathrm{cap}}(D) \int_{\Omega} \Gamma^{k}(y - y') u(y') \rho(y') \mathrm{d}y'.$$

Sketch of the derivation

We outline the proof for sound-absorbing metamaterials. The main steps of the derivation are:

1. the scattered field of a single resonator sD centered at 0 can be written

$$u_s(x) \simeq -s \operatorname{cap}(D) u_{\operatorname{in}}(0) (1 + O(\omega) + O(|x|^{-1})) \Gamma^k(x)$$

2. the Foldy-Lax approximation assumes that the scattered field at a point y_i is obtained by summing the contributions of the total wave field experienced by the other resonators:

$$u_{s,N}(y_i) - u_{\mathrm{in}}(y_i) \simeq -\mathrm{scap}\left(D\right) \sum_{1 \leq j \neq i \leq N} u_{s,N}(y_j) \Gamma^k(y_i - y_j)$$

Justification with layer potentials

3. Assuming that $(y_i)_{i \in \mathbb{N}}$ is randomly and independently distributed according to ρdx , we expect the convergence of $(u_{s,N}(y_i)_{1 \le i \le N})$ to the values $(u(y_i))_{1 \le i \le N}$ where u is the solution to the integral equation:

$$u(y) - u_{\rm in}(y) = -sN_{\rm cap}(D)\int_{\Omega}\Gamma^{k}(y-y')u(y')\rho(y')\mathrm{d}y'.$$

Justification with a convergence argument of random operators.

We outline the proof for sound-absorbing metamaterials.

We outline the proof for sound-absorbing metamaterials.

We rely on the following single layer potential representation of the total field:

$$u_{N,s} = u_{in} - S^k_{D_{N,s}}[(S^k_{D_{N,s}})^{-1}[u_{in}]]$$

We outline the proof for sound-absorbing metamaterials. We rely on the following single layer potential representation of the total field:

$$u_{N,s} = u_{\mathrm{in}} - \mathcal{S}^k_{D_{N,s}}[(\mathcal{S}^k_{D_{N,s}})^{-1}[u_{\mathrm{in}}]]$$

where $D_{N,s} = \cup_{i=1}^{N} (y_i + sD_i)$ and

$$\mathcal{S}_{D_{N,s}}^{k}[\phi](x) := \int_{\partial D_{N,s}} \Gamma^{k}(x-y)\phi(y)\mathrm{d}y \text{ for } \phi \in L^{2}(D_{N,s}), \quad \Gamma^{k}(x-y) = -\frac{e^{ik\pi|x-y|}}{4\pi|x-y|}.$$
We outline the proof for sound-absorbing metamaterials. We rely on the following single layer potential representation of the total field:

$$u_{N,s} = u_{\mathrm{in}} - \mathcal{S}^k_{D_{N,s}}[(\mathcal{S}^k_{D_{N,s}})^{-1}[u_{\mathrm{in}}]]$$

where $D_{N,s} = \cup_{i=1}^{N} (y_i + sD_i)$ and

$$\mathcal{S}_{D_{N,s}}^k[\phi](x) := \int_{\partial D_{N,s}} \Gamma^k(x-y)\phi(y) \mathrm{d}y \text{ for } \phi \in L^2(D_{N,s}), \quad \Gamma^k(x-y) = -\frac{e^{\mathrm{i}k\pi|x-y|}}{4\pi|x-y|}.$$

▶ We perform asymptotic expansions of $S_{D_{N,s}}^k$ with respect to $s \to 0$, with estimates uniform in s and N.

We outline the proof for sound-absorbing metamaterials. We rely on the following single layer potential representation of the total field:

$$u_{N,s} = u_{\mathrm{in}} - \mathcal{S}^k_{D_{N,s}}[(\mathcal{S}^k_{D_{N,s}})^{-1}[u_{\mathrm{in}}]]$$

where $D_{N,s} = \cup_{i=1}^{N} (y_i + sD_i)$ and

$$\mathcal{S}_{D_{N,s}}^k[\phi](x) := \int_{\partial D_{N,s}} \Gamma^k(x-y)\phi(y) \mathrm{d}y \text{ for } \phi \in L^2(D_{N,s}), \quad \Gamma^k(x-y) = -\frac{e^{ik\pi|x-y|}}{4\pi|x-y|}.$$

- ▶ We perform asymptotic expansions of $S_{D_{N,s}}^k$ with respect to $s \to 0$, with estimates uniform in s and N.
- There is some analiticity with respect to s:

$$\mathcal{S}_{\mathcal{D}_{N,s}}^{k} = \mathcal{P}_{N,s} \mathcal{S}_{\mathcal{D}}^{k}(s) \mathcal{P}_{N,s}^{-1} \text{ where } \mathcal{P}_{N,s}[\phi] = (\phi \circ \tau_{y_{i},s}^{-1})_{1 \leq i \leq N} \text{ with } \tau_{y_{i},s}(t) = y_{i} + st$$

for some holomorphic operator $\mathcal{S}_{\mathcal{D}}^k(s)$ on $L^2(D_1) \times \cdots \times L^2(D_N)$.

The operator $\mathcal{S}^k_{\mathcal{D}}(s)$ is given by

$$\mathcal{S}^k_\mathcal{D}(\mathbf{s}) := \mathbf{s}\mathcal{S}_{\mathcal{D},0} + \mathbf{s}^2\mathcal{S}^k_{\mathcal{D},1} + \sum_{
ho=2}^{+\infty} \mathbf{s}^{
ho+1}\mathcal{S}^k_{\mathcal{D},
ho},$$

for some operators $\mathcal{S}^k_{\mathcal{D},p}$ which decay geometrically in the operator norm:

The variable ℓ_N is the quantity homogeneous to a distance defined by

$$\ell_N := \left(\sum_{1 \le i
eq j \le N} \frac{1}{|y_i - y_j|^2}\right)^{-rac{1}{2}}.$$

The operator $\mathcal{S}^k_{\mathcal{D}}(s)$ is given by

$$\mathcal{S}^k_\mathcal{D}(s) := s\mathcal{S}_{\mathcal{D},0} + s^2\mathcal{S}^k_{\mathcal{D},1} + \sum_{p=2}^{+\infty} s^{p+1}\mathcal{S}^k_{\mathcal{D},p},$$

for some operators $\mathcal{S}^k_{\mathcal{D},p}$ which decay geometrically in the operator norm:

$$|||s^{p}\mathcal{S}_{\mathcal{D},p}^{k}|||_{L^{2}(\partial\mathcal{D})\to\mathcal{H}^{1}(\partial\mathcal{D})} \leq c \times \begin{cases} 1 \text{ if } p = 0, \\ s\ell_{N}^{-1} \text{ if } p = 1, \\ s\ell_{N}^{-1}\eta_{N}^{p-1} \text{ if } p \geq 2. \end{cases}$$

The variable ℓ_N is the quantity homogeneous to a distance defined by

$$\ell_{N}:=\left(\sum_{1\leq i
eq j\leq N}rac{1}{|y_i-y_j|^2}
ight)^{-rac{1}{2}}$$

For independently randomly distributed (y_i) , we can show that with high probability, $\ell_N = O(N^{-1})$, whence the role played by $s\ell_N^{-1} = O(sN)$.

The operator $\mathcal{S}^k_{\mathcal{D}}(s)$ is given by

$$\mathcal{S}^k_\mathcal{D}(oldsymbol{s}) := oldsymbol{s} \mathcal{S}_{\mathcal{D},0} + oldsymbol{s}^2 \mathcal{S}^k_{\mathcal{D},1} + \sum_{
ho=2}^{+\infty} oldsymbol{s}^{
ho+1} \mathcal{S}^k_{\mathcal{D},
ho},$$

for some operators $\mathcal{S}^k_{\mathcal{D},p}$ which decay geometrically in the operator norm:

$$|||s^{p}\mathcal{S}_{\mathcal{D},p}^{k}|||_{L^{2}(\partial\mathcal{D})\to\mathcal{H}^{1}(\partial\mathcal{D})} \leq c \times \begin{cases} 1 \text{ if } p = 0, \\ s\ell_{N}^{-1} \text{ if } p = 1, \\ s\ell_{N}^{-1}\eta_{N}^{p-1} \text{ if } p \geq 2. \end{cases}$$

The variable η_N is the ratio between the size *s* and the minimum distance ϵ_N between the centers (we can assume $\eta_N < 1$):

$$\eta_N := \frac{s}{\epsilon_N}$$
 with $\epsilon_N := \min_{1 \le i \le N} |y_i - y_j|$

The operator $\mathcal{S}^k_{\mathcal{D}}(s)$ is given by

$$\mathcal{S}^k_\mathcal{D}(oldsymbol{s}) := oldsymbol{s} \mathcal{S}_{\mathcal{D},0} + oldsymbol{s}^2 \mathcal{S}^k_{\mathcal{D},1} + \sum_{oldsymbol{p}=2}^{+\infty} oldsymbol{s}^{p+1} \mathcal{S}^k_{\mathcal{D},oldsymbol{p}},$$

for some operators $\mathcal{S}^k_{\mathcal{D},p}$ which decay geometrically in the operator norm:

$$|||s^{p}\mathcal{S}_{\mathcal{D},p}^{k}|||_{L^{2}(\partial\mathcal{D})\to\mathcal{H}^{1}(\partial\mathcal{D})} \leq c \times \begin{cases} 1 \text{ if } p = 0, \\ s\ell_{N}^{-1} \text{ if } p = 1, \\ s\ell_{N}^{-1}\eta_{N}^{p-1} \text{ if } p \geq 2. \end{cases}$$

The variable η_N is the ratio between the size *s* and the minimum distance ϵ_N between the centers (we can assume $\eta_N < 1$):

$$\eta_N := rac{s}{\epsilon_N} ext{ with } \epsilon_N := \min_{1 \le i \le N} |y_i - y_j|.$$

For independently randomly distributed (y_i) , we can show that with high probability, $\epsilon_N = O(N^{-\frac{2}{3}})$ (this is smaller than $O(N^{-\frac{1}{3}})$ corresponding to regularly spaced obstacles).

The operator $\mathcal{S}^k_{\mathcal{D}}(s)$ is given by

$$\mathcal{S}^k_\mathcal{D}(oldsymbol{s}) := oldsymbol{s} \mathcal{S}_{\mathcal{D},0} + oldsymbol{s}^2 \mathcal{S}^k_{\mathcal{D},1} + \sum_{oldsymbol{p}=2}^{+\infty} oldsymbol{s}^{p+1} \mathcal{S}^k_{\mathcal{D},oldsymbol{p}},$$

for some operators $\mathcal{S}^k_{\mathcal{D},p}$ which decay geometrically in the operator norm:

$$|||s^{p}\mathcal{S}_{\mathcal{D},p}^{k}|||_{L^{2}(\partial\mathcal{D})\to\mathcal{H}^{1}(\partial\mathcal{D})} \leq c \times \begin{cases} 1 \text{ if } p = 0, \\ s\ell_{N}^{-1} \text{ if } p = 1, \\ s\ell_{N}^{-1}\eta_{N}^{p-1} \text{ if } p \geq 2. \end{cases}$$

The variable η_N is the ratio between the size *s* and the minimum distance ϵ_N between the centers (we can assume $\eta_N < 1$):

$$\eta_N := rac{s}{\epsilon_N} ext{ with } \epsilon_N := \min_{1 \leq i \leq N} |y_i - y_j|.$$

For independently randomly distributed (y_i) , we can show that with high probability, $\epsilon_N = O(N^{-\frac{2}{3}})$ (this is smaller than $O(N^{-\frac{1}{3}})$ corresponding to regularly spaced obstacles). We have $s\ell_N^{-1}\eta_N = O(sNsN^{\frac{2}{3}}) = O((sN)^2N^{-\frac{1}{3}})$ which is at the origin of the claimed rate of convergence.

Sketch of the derivation

Proposition 1

Assume assumptions 1, 2 and 3 and denote by u the solution to the Lippmann-Schwinger equation

$$\begin{cases} \Delta u + (k^2 - sN \operatorname{cap}(D)\rho \mathbf{1}_{\Omega})u = 0 \ in \ \mathbb{R}^3, \\ \left(\frac{\partial}{\partial |x|} - \mathrm{i}k\right)(u - u_{\mathrm{in}}) = O(|x|^{-2}) \ \text{as } |x| \to +\infty. \end{cases}$$
(1)

There exists an event \mathcal{H}_{N_0} which holds with large probability $\mathbb{P}(\mathcal{H}_{N_0}) \to 1$ as $N_0 \to +\infty$ such that when \mathcal{H}_{N_0} is realized, the function u is an approximation of the total wave field $u_{N,s}$ with the following error estimates:

1. on any ball B(0,r) containing the obstacles, $\Omega \subset B(0,r)$ and for any $N \ge N_0$:

$$\mathbb{E}[||u_{N,s} - u||^{2}_{L^{2}(B(0,r))}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \le csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}});$$
(2)

2. on any bounded open subset $A \subset \mathbb{R}^3 \setminus \Omega$ away from the obstacles and for any $N \ge N_0$:

$$\mathbb{E}[||\nabla u_{N,s} - \nabla u||_{L^{2}(\mathcal{A})}^{2}|\mathcal{H}_{N_{0}}]^{\frac{1}{2}} \leq csN\max((sN)^{2}N^{-\frac{1}{3}}, N^{-\frac{1}{2}}).$$
(3)

The relative error is of order $O(\max((sN)^2N^{-\frac{1}{3}}, N^{-\frac{1}{2}}))$ because the scattered fields $u_{N,s} - u_{in}$ and $u - u_{in}$ are of order O(sN).

The operator $\mathcal{S}^k_{\mathcal{D}}(s)$ is given by

$$\mathcal{S}^k_\mathcal{D}(oldsymbol{s}) := oldsymbol{s} \mathcal{S}_{\mathcal{D},0} + oldsymbol{s}^2 \mathcal{S}^k_{\mathcal{D},1} + \sum_{oldsymbol{p}=2}^{+\infty} oldsymbol{s}^{p+1} \mathcal{S}^k_{\mathcal{D},oldsymbol{p}},$$

for some operators $\mathcal{S}^k_{\mathcal{D},p}$ which decay geometrically in the operator norm:

$$|||s^{p}\mathcal{S}_{\mathcal{D},p}^{k}|||_{L^{2}(\partial\mathcal{D})\to\mathcal{H}^{1}(\partial\mathcal{D})} \leq c \times \begin{cases} 1 \text{ if } p = 0, \\ s\ell_{N}^{-1} \text{ if } p = 1, \\ s\ell_{N}^{-1}\eta_{N}^{p-1} \text{ if } p \geq 2. \end{cases}$$

The variable η_N is the ratio between the size *s* and the minimum distance ϵ_N between the centers (we can assume $\eta_N < 1$):

$$\eta_N := rac{s}{\epsilon_N} ext{ with } \epsilon_N := \min_{1 \leq i \leq N} |y_i - y_j|.$$

For independently randomly distributed (y_i) , we can show that with high probability, $\epsilon_N = O(N^{-\frac{2}{3}})$ (this is smaller than $O(N^{-\frac{1}{3}})$ corresponding to regularly spaced obstacles). We have $s\ell_N^{-1}\eta_N = O(sNsN^{\frac{2}{3}}) = O((sN)^2N^{-\frac{1}{3}})$ which is at the origin of the claimed rate of convergence. • Computing the inverse of $\mathcal{S}_{\mathcal{D}}^{k}(s)$, we obtain

$$(S_{D_{N,s}}^{k})^{-1}[u_{\mathrm{in}}] \simeq -\frac{s^{-1}}{\mathrm{cap}(D)} \sum_{i=1}^{N} z_{i}^{N} S_{D}^{-1}[1_{\partial D}] \circ \tau_{y_{i},s}^{-1},$$

where $(z_i^N)_{1 \le i \le N}$ is the solution to the algebraic system

$$z_i^N - \operatorname{cap}(D) s \sum_{1 \leq j \neq i \leq N} \Gamma^k(y_i - y_j) z_j^N = -\operatorname{cap}(D) u_{\operatorname{in}}(y_i), \qquad 1 \leq i \leq N.$$

• Computing the inverse of $\mathcal{S}_{\mathcal{D}}^{k}(s)$, we obtain

$$(\mathcal{S}_{D_{N,s}}^{k})^{-1}[u_{\mathrm{in}}] \simeq - rac{s^{-1}}{\mathrm{cap}\,(D)} \sum_{i=1}^{N} z_{i}^{N} \mathcal{S}_{D}^{-1}[1_{\partial D}] \circ \tau_{y_{i},s}^{-1},$$

where $(z_i^N)_{1 \le i \le N}$ is the solution to the algebraic system

$$z_i^N - \operatorname{cap}(D)s \sum_{1 \leq j \neq i \leq N} \Gamma^k(y_i - y_j) z_j^N = -\operatorname{cap}(D) u_{\operatorname{in}}(y_i), \qquad 1 \leq i \leq N.$$

This system is called the "Foldy-Lax approximation" of the scattering problem. Indeed, the scattered field has the following point-wise behavior away from the obstacles:

$$u_{N,s}(x) - u_{in}(x) = -\sum_{i=1}^{N} s z_i^N \Gamma^k(x - y_i) + O(s(sN)),$$

• Computing the inverse of $\mathcal{S}_{\mathcal{D}}^{k}(s)$, we obtain

$$(\mathcal{S}_{D_{N,s}}^{k})^{-1}[u_{\mathrm{in}}] \simeq - rac{s^{-1}}{\mathrm{cap}\,(D)} \sum_{i=1}^{N} z_{i}^{N} \mathcal{S}_{D}^{-1}[1_{\partial D}] \circ \tau_{y_{i},s}^{-1},$$

where $(z_i^N)_{1 \le i \le N}$ is the solution to the algebraic system

$$z_i^N - \operatorname{cap}(D)s \sum_{1 \leq j \neq i \leq N} \Gamma^k(y_i - y_j) z_j^N = -\operatorname{cap}(D) u_{\operatorname{in}}(y_i), \qquad 1 \leq i \leq N.$$

This system is called the "Foldy-Lax approximation" of the scattering problem. Indeed, the scattered field has the following point-wise behavior away from the obstacles:

$$u_{N,s}(x) - u_{in}(x) = -\sum_{i=1}^{N} s z_i^N \Gamma^k(x - y_i) + O(s(sN)),$$

Convergence to the integral equation

$$z_i^N - \operatorname{cap}(D) s \sum_{1 \le j \ne i \le N} \Gamma^k(y_i - y_j) z_j^N = -\operatorname{cap}(D) u_{\operatorname{in}}(y_i), \qquad 1 \le i \le N.$$

For randomly and independently distributed $(y_i)_{1 \le i \le N}$, we use our recent theory¹ to obtain that as $N \to +\infty$, $z_i^N \simeq z(y_i)$ where z is the solution to the integral equation

$$z(y) - \operatorname{cap}(D) s N \int_{\Omega} \Gamma^k(y - y') z(y')
ho(y') \mathrm{d}y' = -\operatorname{cap}(D) u_{\mathrm{in}}(y), \qquad y \in \Omega_{\mathrm{cap}}(D)$$

¹Feppon and Ammari, Analysis of a Monte-Carlo Nystrom method (2022)

Convergence to the integral equation

$$z_i^N - \operatorname{cap}(D)s \sum_{1 \leq j \neq i \leq N} \Gamma^k(y_i - y_j) z_j^N = -\operatorname{cap}(D) u_{\operatorname{in}}(y_i), \qquad 1 \leq i \leq N.$$

For randomly and independently distributed $(y_i)_{1 \le i \le N}$, we use our recent theory¹ to obtain that as $N \to +\infty$, $z_i^N \simeq z(y_i)$ where z is the solution to the integral equation

$$z(y) - \operatorname{cap}(D) \mathfrak{sN} \int_{\Omega} \Gamma^k(y - y') z(y')
ho(y') \mathrm{d}y' = -\operatorname{cap}(D) u_{\mathrm{in}}(y), \qquad y \in \Omega,$$

In fact, we have the error estimate

$$\mathbb{E}\left[\frac{1}{N}\sum_{i=1}^{N}|z_{i}^{N}-z(y_{i})|^{2}|\mathcal{H}_{N_{0}}\right]\leq csNN^{-\frac{1}{2}} \text{ for all } N\geqslant N_{0}$$

for some highly probable event \mathcal{H}_{N_0} .

¹Feppon and Ammari, Analysis of a Monte-Carlo Nystrom method (2022)

Convergence to the integral equation

$$z_i^N - \operatorname{cap}(D)s \sum_{1 \leq j \neq i \leq N} \Gamma^k(y_i - y_j) z_j^N = -\operatorname{cap}(D) u_{\operatorname{in}}(y_i), \qquad 1 \leq i \leq N.$$

For randomly and independently distributed $(y_i)_{1 \le i \le N}$, we use our recent theory¹ to obtain that as $N \to +\infty$, $z_i^N \simeq z(y_i)$ where z is the solution to the integral equation

$$z(y) - \operatorname{cap}(D) \mathfrak{sN} \int_{\Omega} \Gamma^k(y - y') z(y')
ho(y') \mathrm{d}y' = -\operatorname{cap}(D) u_{\mathrm{in}}(y), \qquad y \in \Omega,$$

In fact, we have the error estimate

$$\mathbb{E}\left[\frac{1}{N}\sum_{i=1}^{N}|z_{i}^{N}-z(y_{i})|^{2}|\mathcal{H}_{N_{0}}\right]\leq csNN^{-\frac{1}{2}} \text{ for all } N\geqslant N_{0}$$

for some highly probable event \mathcal{H}_{N_0} .

This is the origin of the error rate $O(N^{-\frac{1}{2}})$ in the convergence result.

¹Feppon and Ammari, Analysis of a Monte-Carlo Nystrom method (2022)
