ETH Lecture 401-0674-00L Numerical Methods for (Partial) Differential Equations

Numerical Methods for (Partial) Differential Equations

Prof. R. Hiptmair, SAM, ETH Zurich

Spring Term 2023

(C) Seminar für Angewandte Mathematik, ETH Zürich

Welcome and Introduction

0.4 Topic

Better: Numerical methods for the simulation of continuum models with local interactions

continuum $\hat{=}$ unknowns are functions / fields, e.g. $u = u(x)$, $x \in \mathbb{R}^d$
$\in \infty$-dimensional function space

model $\hat{=}$ mathematical description of some aspects of reality
→ Here: PDE-based

$\Rightarrow$ PDE embedded in physical context
→ Not "just an equation" $F(u, Du) = 0$
some (partial) derivatives
→ encodes structural properties
↓
Should be respected / exploited by a numerical method
("Structure-preserving")

0.4.3 Example (Fluid mechanics)

(Stationary, incompressible) Navier-Stokes equations:

$$\begin{aligned} -\nu\Delta\mathbf{u} + D\mathbf{u}\cdot\mathbf{u} + \mathbf{grad}\,p &= \mathbf{f} \quad \text{in } \Omega\,, \\ \operatorname{div}\mathbf{u} &= 0 \quad \text{in } \Omega\,, \\ \mathbf{u} &= 0 \quad \text{on } \partial\Omega\,. \end{aligned} \tag{0.4.3.1}$$

dissipation

$\longrightarrow$ incompressibility

ν	$\hat{=}$	dynamic viscosity
$\mathbf{f}:\Omega\mapsto\mathbb{R}^3$	$\hat{=}$	given external force field
$\mathbf{u}:\Omega\mapsto\mathbb{R}^3$	$\hat{=}$	velocity field (unknown)
$p:\Omega\mapsto\mathbb{R}$	$\hat{=}$	pressure (unknown)

0.3 Prerequisites

In (0.4.3.1): differential operators grad, div, Δ

$\longrightarrow$ advanced (vector) calculus

$\longrightarrow$ multi-dimensional integration/differentiation

Of course: Basic numerical methods (quadrature, numerical LA, numerical integration, ...)

and C++

Contents and Outline

Model classes covered in this course (2023 edition)

I. Equilibrium models

Elastic membranes, electrostatics, stationary heat conduction

II. Evolution models

Heat equation, wave propagation, Schrödinger equation

III. Transport models

0.1.2. Teaching Model

→ Flipped classroom format

A flipped-classroom course

This course will follow the **flipped-classroom** paradigm:

Learning by **self-study** guided by

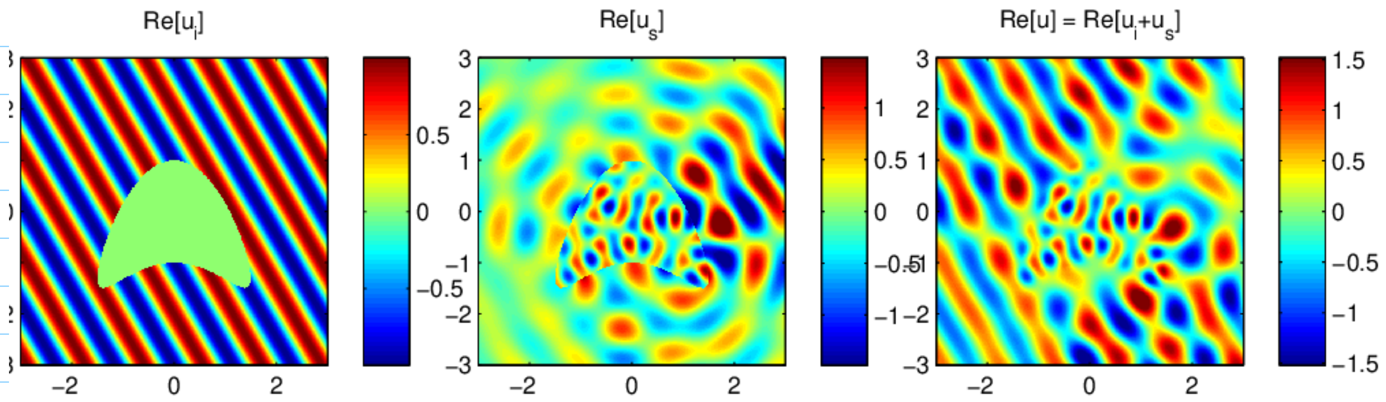
instruction videos tablet notes	lecture notes	interactive Q&A sessions	homework tutorial classes
↓ assigned every week (Moodle page)	↓ Also supplementary	↓ Submit questions through Discord channels	↓
↓ Define course contents			

$\underbrace{\text{instruction videos, lecture notes}}_{3\text{-}5\ h/\text{week}}$ 7-10 h/week

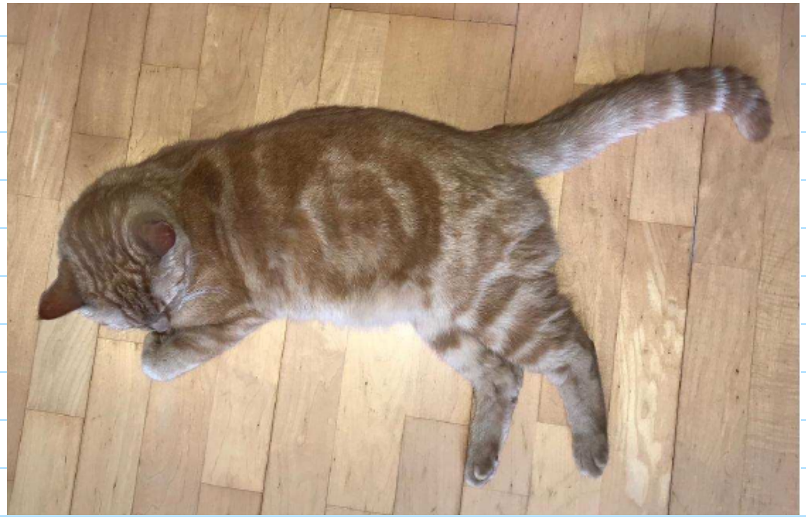
Flipped classroom advice:

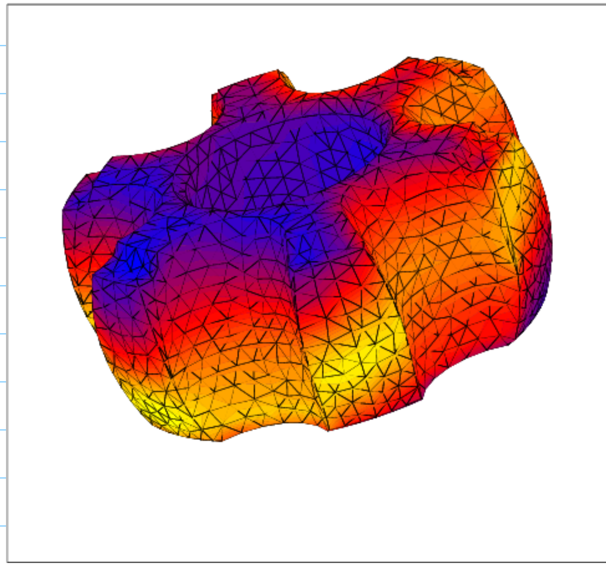
- Reserve time slots
- Stable setting / routine
- Take breaks
- Group study

Much success with NumPDE !



Left: incident wave; middle: scattered field, right: total pressure p (real parts). Computation with method of particular solutions, using the software MPSPACK,





NumPDE@ETHZ
