

Numerical Methods for Partial Differential Equations

Prof. R. Hiptmair, SAM, ETH Zurich

Spring Term 2019

(C) Seminar für Angewandte Mathematik, ETH Zürich

Q & A Session
April 1, 2019

Mittlerm 0-4:

$$b_k^1(x) = 1 - \frac{x}{h}$$

$$b_k^2(x) = \frac{x}{h}$$

$$\frac{db_k^1}{dx}(x) = -\frac{1}{h}$$

$$\frac{db_k^2}{dx}(x) = \frac{1}{h}$$

$$\begin{aligned} \bullet &= \int_0^h -\frac{1}{h} \left(1 - \frac{x}{h}\right) dx = \int_0^h -\frac{1}{h} + \frac{x}{h^2} dx = \\ &= -1 + \frac{1}{2} = -\frac{1}{2} \end{aligned}$$

Trick: $b(\{x \mapsto 1\}v) = 0$

Row sum = 0

$$\bullet \int_0^h \frac{1}{h} \left(1 - \frac{x}{h}\right) dx = \frac{1}{2}$$

$$\bullet (A_k)_{ij} = a(b_h^j, b_h^i)$$

$$\bullet \int_0^h -\frac{1}{h} \cdot \frac{x}{h} dx = -\frac{1}{2}$$
