§1. Nonsingular curves

Let C be a complete, nonsingular, irreducible curve of genus $g \geq 2$:

The curve C has a complex structure which we can vary (while keeping the topology fixed).

Riemann studied the moduli space \mathcal{M}_g of all genus g curves:

Riemann knew \mathcal{M}_g was (essentially) a complex manifold of dimension $3g-3$.

Theorie der *Abel'schen* Functionen.

(Von Herrn *B. Riemann*.)

Theorie der *Abel'schen* Functionen.

(Von Herrn *B. Riemann*.)

Die $3p-3$ übrigen Verzweigungswerthe in jenen Systemen gleichverzweigter μ werthiger Functionen können daher beliebige Werthe annehmen; und es hängt also eine Klasse von Systemen gleichverzweigter $2p+1$ fach zusammenhangender Functionen und die zu ihr gehörende Klasse algebraischer Gleichungen von $3p-3$ stetig veränderlichen Größen ab, welche die Moduln dieser Klasse genannt werden sollen.

Theorie der *Abel'schen* Functionen.

(Von Herrn *B. Riemann*.)

Die $3p - 3$ übrigen Verzweigungswerthe in jenen Systemen gleichverzweigter μ werthiger Functionen können daher beliebige Werthe annehmen; und es hängt also eine Klasse von Systemen gleichverzweigter $2p + 1$ fach zusammenhangender Functionen und die zu ihr gehörende Klasse algebraischer Gleichungen von $3p - 3$ stetig veränderlichen Größen ab, welche die Moduln dieser Klasse genannt werden sollen.

Riemann constructs the variations (via moving branch points), states the dimension, and coins the term moduli in a single sentence.

We are interested here in the cohomology of \mathcal{M}_g .

There are two basic questions:

(i) What is the cohomology $H^*(\mathcal{M}_g, \mathbb{Q})$ for fixed g ?

(ii) What is the $\lim_{g \rightarrow \infty} H^*(\mathcal{M}_g, \mathbb{Q})$?

We are interested here in the cohomology of \mathcal{M}_g .

There are two basic questions:

(i) What is the cohomology $H^*(\mathcal{M}_g, \mathbb{Q})$ for fixed g ?

(ii) What is the $\lim_{g \rightarrow \infty} H^*(\mathcal{M}_g, \mathbb{Q})$?

Both inspired by work of **Mumford** in the 70s and 80s following the previously developed **Schubert** calculus of the **Grassmannian**.

§II. Grassmannian

Let \mathbb{C}^n be a n -dimensional complex vector space. The Grassmannian $\text{Gr}(r, n)$ parameterizes all r -dimensional linear subspaces of \mathbb{C}^n .

- (i) What is the cohomology $H^*(\text{Gr}(r, n), \mathbb{Q})$ for fixed n ?
- (ii) What is the $\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q})$?

§II. Grassmannian

Let \mathbb{C}^n be a n -dimensional complex vector space. The Grassmannian $\text{Gr}(r, n)$ parameterizes all r -dimensional linear subspaces of \mathbb{C}^n .

- (i) What is the cohomology $H^*(\text{Gr}(r, n), \mathbb{Q})$ for fixed n ?
- (ii) What is the $\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q})$?

The answers to (i) and (ii) are very well-known. The study has modern origins in [Schubert's](#) work. The rigorization of the [Schubert](#) calculus was [Hilbert's 15th problem](#).

Let $S \subset \mathbb{C}^n \times \text{Gr}(r, n)$ be the universal subbundle.

$$\begin{array}{ccc} S & \supset & V \\ \pi \downarrow & & \downarrow \\ \text{Gr}(r, n) & \ni & [V \subset \mathbb{C}^n] \\ & & \dim_{\mathbb{C}} V = r \end{array}$$

Let $S \subset \mathbb{C}^n \times \text{Gr}(r, n)$ be the universal subbundle.

$$\begin{array}{ccc} S & \supset & V \\ \pi \downarrow & & \downarrow \\ \text{Gr}(r, n) & \ni & [V \subset \mathbb{C}^n] \\ & & \dim_{\mathbb{C}} V = r \end{array}$$

- $H^*(\text{Gr}(r, n), \mathbb{Q})$ is generated by the Chern classes of S ,

$$c_i(S) \in H^{2i}(\text{Gr}(r, n), \mathbb{Q}).$$

There are r Chern classes $c_1(S), \dots, c_r(S)$.

Since S is a subbundle of the trivial rank n bundle over $\text{Gr}(r, n)$, the quotient

$$0 \rightarrow S \rightarrow \mathbb{C}^n \times \text{Gr}(r, n) \rightarrow Q \rightarrow 0$$

is a bundle Q of rank $n - r$. The Chern classes of Q are

$$c(Q) = \sum_{i \geq 0} c_i(Q) = \frac{1}{1 + c_1(S) + \dots + c_r(S)}.$$

Since S is a subbundle of the trivial rank n bundle over $\text{Gr}(r, n)$, the quotient

$$0 \rightarrow S \rightarrow \mathbb{C}^n \times \text{Gr}(r, n) \rightarrow Q \rightarrow 0$$

is a bundle Q of rank $n - r$. The Chern classes of Q are

$$c(Q) = \sum_{i \geq 0} c_i(Q) = \frac{1}{1 + c_1(S) + \dots + c_r(S)}.$$

- The ideal of relations in $H^*(\text{Gr}(r, n), \mathbb{Q})$ among the $c_i(S)$ is generated by the vanishing of the Chern classes of Q

$$c_{n-r+i}(Q) = \left[\frac{1}{1 + c_1(S) + \dots + c_r(S)} \right]_{n-r+i} = 0$$

for $1 \leq i \leq r$.

The natural inclusion $\mathbb{C}^n \subset \mathbb{C}^{n+1}$, yields a natural inclusion

$$\text{Gr}(r, n) \subset \text{Gr}(r, n + 1)$$

and natural limit $\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q})$.

The natural inclusion $\mathbb{C}^n \subset \mathbb{C}^{n+1}$, yields a natural inclusion

$$\text{Gr}(r, n) \subset \text{Gr}(r, n + 1)$$

and natural limit $\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q})$.

- Since the relations in $H^*(\text{Gr}(r, n), \mathbb{Q})$ start in degree $n - r + 1$, the limit is free:

$$\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q}) = \mathbb{Q}[c_1(S), \dots, c_r(S)] .$$

Can also be interpreted as the group cohomology of $\text{GL}(r, \mathbb{C})$.

The natural inclusion $\mathbb{C}^n \subset \mathbb{C}^{n+1}$, yields a natural inclusion

$$\text{Gr}(r, n) \subset \text{Gr}(r, n + 1)$$

and natural limit $\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q})$.

- Since the relations in $H^*(\text{Gr}(r, n), \mathbb{Q})$ start in degree $n - r + 1$, the limit is free:

$$\lim_{n \rightarrow \infty} H^*(\text{Gr}(r, n), \mathbb{Q}) = \mathbb{Q}[c_1(S), \dots, c_r(S)] .$$

Can also be interpreted as the group cohomology of $\text{GL}(r, \mathbb{C})$.

For the **Grassmannian**, we have very satisfactory answers to the **two original questions** in terms of tautological structures.

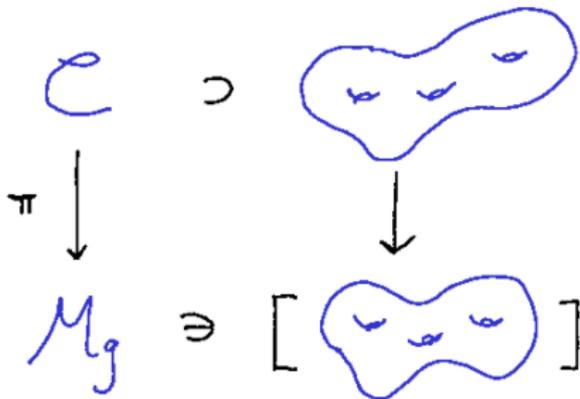

§III. Tautological classes on \mathcal{M}_g

What is the analogue of **S** for the moduli space of curves?

§III. Tautological classes on \mathcal{M}_g

What is the analogue of S for the moduli space of curves?

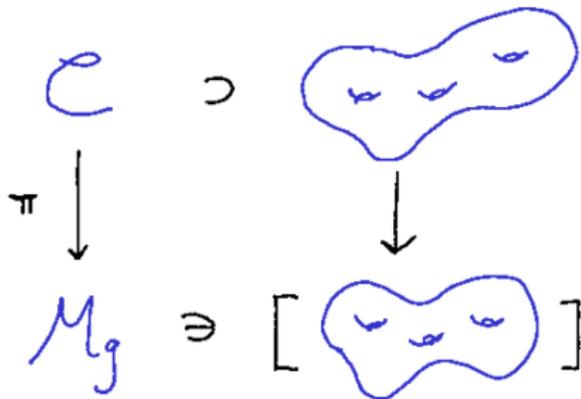

Answer: the universal curve \mathcal{C} :

§III. Tautological classes on \mathcal{M}_g

What is the analogue of **S** for the **moduli space of curves**?

Answer: the **universal curve** \mathcal{C} :

We can not directly take **Chern classes** of the universal curve since

$$\pi : \mathcal{C} \rightarrow \mathcal{M}_g$$

is **not** a vector bundle.

Let \mathcal{L} be the cotangent line over the universal curve,

$$\begin{array}{ccc} \mathcal{L} & \supset & T_P^* \left(\text{genus-3 surface} \right) \\ \downarrow & & \downarrow \\ \mathcal{C} & \ni & \left[\text{genus-3 surface with point } P \right] \end{array}$$

Let \mathcal{L} be the cotangent line over the universal curve,

$$\begin{array}{ccc}
 \mathcal{L} & \supset & T_P^* \left(\text{genus-3 surface} \right) \\
 \downarrow & & \downarrow \\
 \mathcal{C} & \ni & \left[\text{genus-3 surface with point } P \right]
 \end{array}$$

Since $\mathcal{L} \rightarrow \mathcal{C}$ is a line bundle, we can define

$$\psi = c_1(\mathcal{L}) \in H^2(\mathcal{C}, \mathbb{Q}) .$$

Via integration along the fiber of $\pi : \mathcal{C} \rightarrow \mathcal{M}_g$, we define

$$\kappa_i = \pi_*(\psi^{i+1}) \in H^{2i}(\mathcal{M}_g, \mathbb{Q}) .$$

Let $R^*(\mathcal{M}_g) \subset H^*(\mathcal{M}_g, \mathbb{Q})$ denote the **subring** generated by the κ classes.

Via integration along the fiber of $\pi : \mathcal{C} \rightarrow \mathcal{M}_g$, we define

$$\kappa_j = \pi_*(\psi^{j+1}) \in H^{2j}(\mathcal{M}_g, \mathbb{Q}) .$$

Let $R^*(\mathcal{M}_g) \subset H^*(\mathcal{M}_g, \mathbb{Q})$ denote the **subring** generated by the κ classes.

Question: Is $R^*(\mathcal{M}_g) = H^*(\mathcal{M}_g, \mathbb{Q})$?

Via integration along the fiber of $\pi : \mathcal{C} \rightarrow \mathcal{M}_g$, we define

$$\kappa_i = \pi_*(\psi^{i+1}) \in H^{2i}(\mathcal{M}_g, \mathbb{Q}) .$$

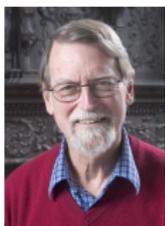

Let $R^*(\mathcal{M}_g) \subset H^*(\mathcal{M}_g, \mathbb{Q})$ denote the **subring** generated by the κ classes.

Question: Is $R^*(\mathcal{M}_g) = H^*(\mathcal{M}_g, \mathbb{Q})$?

Answer: **No**, but yes stably.

Mumford's Conjecture / Madsen-Weiss Theorem:

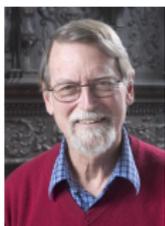

$$\lim_{g \rightarrow \infty} H^*(\mathcal{M}_g, \mathbb{Q}) = \mathbb{Q}[\kappa_1, \kappa_2, \kappa_3, \dots] .$$

For fixed genus g , we take Mumford's Conjecture as motivation to restrict our attention to the tautological subring

$$R^*(\mathcal{M}_g) \subset H^*(\mathcal{M}_g, \mathbb{Q}) .$$

Other motivation comes from classical constructions in algebraic geometry: most interesting classes typically lie in $R^*(\mathcal{M}_g)$.

For fixed genus g , we take Mumford's Conjecture as motivation to restriction our attention to the tautological subring

$$R^*(\mathcal{M}_g) \subset H^*(\mathcal{M}_g, \mathbb{Q}) .$$

Other motivation comes from classical constructions in algebraic geometry: most interesting classes typically lie in $R^*(\mathcal{M}_g)$.

Question: What is the structure of the ring $R^*(\mathcal{M}_g)$?

For fixed genus g , we take Mumford's Conjecture as motivation to restrict our attention to the tautological subring

$$R^*(\mathcal{M}_g) \subset H^*(\mathcal{M}_g, \mathbb{Q}) .$$

Other motivation comes from classical constructions in algebraic geometry: most interesting classes typically lie in $R^*(\mathcal{M}_g)$.

Question: What is the structure of the ring $R^*(\mathcal{M}_g)$?

Question: What is the ideal of relations

$$0 \rightarrow \mathcal{I}_g \rightarrow \mathbb{Q}[\kappa_1, \kappa_2, \kappa_3, \dots] \rightarrow R^*(\mathcal{M}_g) \rightarrow 0 ?$$

§IV. Faber-Zagier Conjecture

Results by Looijenga and Faber determine the *lower end* of the tautological ring

$$R^{g-2}(\mathcal{M}_g) = \mathbb{Q} , \quad R^{>g-2}(\mathcal{M}_g) = 0 .$$

We use here the complex grading, so $R^{g-2}(\mathcal{M}_g) \subset H^{2(g-2)}(\mathcal{M}_g)$.

The study of $R^{g-2}(\mathcal{M}_g)$ and the κ proportionalities is a rich subject, but we take a different direction here.

§IV. Faber-Zagier Conjecture

Results by Looijenga and Faber determine the *lower end* of the tautological ring

$$R^{g-2}(\mathcal{M}_g) = \mathbb{Q}, \quad R^{>g-2}(\mathcal{M}_g) = 0.$$

We use here the complex grading, so $R^{g-2}(\mathcal{M}_g) \subset H^{2(g-2)}(\mathcal{M}_g)$.

The study of $R^{g-2}(\mathcal{M}_g)$ and the κ proportionalities is a rich subject, but we take a different direction here.

We are interested in the full ideal of relations

$$\mathcal{I}_g \subset \mathbb{Q}[\kappa_1, \kappa_2, \kappa_3, \dots]$$

of $R^*(\mathcal{M}_g)$. Mumford started the study of \mathcal{I}_g , but the subject was first attacked systematically by Faber starting around 1990.

§IV. Faber-Zagier Conjecture

Results by Looijenga and Faber determine the *lower end* of the tautological ring

$$R^{g-2}(\mathcal{M}_g) = \mathbb{Q}, \quad R^{>g-2}(\mathcal{M}_g) = 0.$$

We use here the complex grading, so $R^{g-2}(\mathcal{M}_g) \subset H^{2(g-2)}(\mathcal{M}_g)$.

The study of $R^{g-2}(\mathcal{M}_g)$ and the κ proportionalities is a rich subject, but we take a different direction here.

We are interested in the full ideal of relations

$$\mathcal{I}_g \subset \mathbb{Q}[\kappa_1, \kappa_2, \kappa_3, \dots]$$

of $R^*(\mathcal{M}_g)$. Mumford started the study of \mathcal{I}_g , but the subject was first attacked systematically by Faber starting around 1990.

Faber's method of construction involved the classical geometry of curves and Brill-Noether theory. The outcome in 2000 was the following Conjecture formulated with Zagier.

To write the **Faber-Zagier** relations, let the variable set

$$\mathbf{p} = \{ p_1, p_3, p_4, p_6, p_7, p_9, p_{10}, \dots \}$$

be indexed by positive integers *not* congruent to 2 modulo 3.

To write the **Faber-Zagier** relations, let the variable set

$$\mathbf{p} = \{ p_1, p_3, p_4, p_6, p_7, p_9, p_{10}, \dots \}$$

be indexed by positive integers *not* congruent to 2 modulo 3.
Define the series

$$\begin{aligned} \Psi(t, \mathbf{p}) = & (1 + t p_3 + t^2 p_6 + t^3 p_9 + \dots) \sum_{i=0}^{\infty} \frac{(6i)!}{(3i)!(2i)!} t^i \\ & + (p_1 + t p_4 + t^2 p_7 + \dots) \sum_{i=0}^{\infty} \frac{(6i)!}{(3i)!(2i)!} \frac{6i+1}{6i-1} t^i. \end{aligned}$$

Since Ψ has **constant** term 1, we may take the logarithm.

Define the constants $C_r^{\text{FZ}}(\sigma)$ by the formula

$$\log(\Psi) = \sum_{\sigma} \sum_{r=0}^{\infty} C_r^{\text{FZ}}(\sigma) t^r \mathbf{p}^{\sigma} .$$

The sum is over all partitions σ of size $|\sigma|$ which avoid parts congruent to 2 modulo 3. To the partition

$$\sigma = 1^{n_1} 3^{n_3} 4^{n_4} \dots,$$

we associate the monomial $\mathbf{p}^{\sigma} = p_1^{n_1} p_3^{n_3} p_4^{n_4} \dots$.

Define the constants $C_r^{\text{FZ}}(\sigma)$ by the formula

$$\log(\Psi) = \sum_{\sigma} \sum_{r=0}^{\infty} C_r^{\text{FZ}}(\sigma) t^r \mathbf{p}^{\sigma} .$$

The sum is over all partitions σ of size $|\sigma|$ which avoid parts congruent to 2 modulo 3. To the partition

$$\sigma = 1^{n_1} 3^{n_3} 4^{n_4} \dots ,$$

we associate the monomial $\mathbf{p}^{\sigma} = p_1^{n_1} p_3^{n_3} p_4^{n_4} \dots$. Let

$$\gamma^{\text{FZ}} = \sum_{\sigma} \sum_{r=0}^{\infty} C_r^{\text{FZ}}(\sigma) \kappa_r t^r \mathbf{p}^{\sigma} .$$

Define the constants $C_r^{\text{FZ}}(\sigma)$ by the formula

$$\log(\Psi) = \sum_{\sigma} \sum_{r=0}^{\infty} C_r^{\text{FZ}}(\sigma) t^r \mathbf{p}^{\sigma}.$$

The sum is over all partitions σ of size $|\sigma|$ which avoid parts congruent to 2 modulo 3. To the partition

$$\sigma = 1^{n_1} 3^{n_3} 4^{n_4} \dots,$$

we associate the monomial $\mathbf{p}^{\sigma} = p_1^{n_1} p_3^{n_3} p_4^{n_4} \dots$. Let

$$\gamma^{\text{FZ}} = \sum_{\sigma} \sum_{r=0}^{\infty} C_r^{\text{FZ}}(\sigma) \kappa_r t^r \mathbf{p}^{\sigma}.$$

For a series $\Theta \in \mathbb{Q}[\kappa][[t, \mathbf{p}]]$ in the variables κ_i , t , and p_j , let

$$[\Theta] t^r \mathbf{p}^{\sigma}$$

denote the coefficient of $t^r \mathbf{p}^{\sigma}$ (which is a polynomial in the κ_i).

Theorem (P.-Pixton 2010)

In $R^r(\mathcal{M}_g)$, the *Faber-Zagier* relation

$$[\exp(-\gamma^{\text{FZ}})]_{t^r p^\sigma} = 0$$

holds when $g - 1 + |\sigma| < 3r$ and $g \equiv r + |\sigma| + 1 \pmod{2}$.

Theorem (P.-Pixton 2010)

In $R^r(\mathcal{M}_g)$, the *Faber-Zagier* relation

$$[\exp(-\gamma^{\text{FZ}})]_{t^r p^\sigma} = 0$$

holds when $g - 1 + |\sigma| < 3r$ and $g \equiv r + |\sigma| + 1 \pmod{2}$.

The g dependence in the *Faber-Zagier* relations of the Theorem occurs in the inequality, the modulo 2 restriction, and

$$\kappa_0 = 2g - 2 .$$

Theorem (P.-Pixton 2010)

In $R^r(\mathcal{M}_g)$, the *Faber-Zagier* relation

$$[\exp(-\gamma^{\text{FZ}})]_{tr\mathbf{p}^\sigma} = 0$$

holds when $g - 1 + |\sigma| < 3r$ and $g \equiv r + |\sigma| + 1 \pmod{2}$.

The g dependence in the *Faber-Zagier* relations of the Theorem occurs in the inequality, the modulo 2 restriction, and

$$\kappa_0 = 2g - 2 .$$

For a given genus g and codimension r , the Theorem provides *finitely* many relations. The \mathbb{Q} -linear span of the *Faber-Zagier* relations determines an ideal

$$\mathcal{I}_g^{\text{FZ}} \subset \mathbb{Q}[\kappa_1, \kappa_2, \kappa_3, \dots] .$$

Question: Is \mathcal{I}_g^{FZ} the complete ideal of relations in $R^*(\mathcal{M}_g)$?

Question: Is \mathcal{I}_g^{FZ} the complete ideal of relations in $R^*(\mathcal{M}_g)$?

Answer: For $g \leq 23$, **yes**. For $g \geq 24$, the answer is **unknown**.
Despite serious efforts using different methods (Faber, Q. Yin, Randal-Williams) no relation **not** in \mathcal{I}_g^{FZ} has been found.

Question: Is \mathcal{I}_g^{FZ} the complete ideal of relations in $R^*(\mathcal{M}_g)$?

Answer: For $g \leq 23$, **yes**. For $g \geq 24$, the answer is **unknown**.
Despite serious efforts using different methods (Faber, Q. Yin, Randal-Williams) no relation **not** in \mathcal{I}_g^{FZ} has been found.

Our construction of the Faber-Zagier relations uses the moduli space of stable quotients which mixes ingredients of Grothendieck's Quot scheme and the Deligne-Mumford compactification

$$\mathcal{M}_g \subset \overline{\mathcal{M}}_g .$$

The geometry of the virtual class of the stable quotient moduli leads eventually to the relations.

Question: Is \mathcal{I}_g^{FZ} the complete ideal of relations in $R^*(\mathcal{M}_g)$?

Answer: For $g \leq 23$, **yes**. For $g \geq 24$, the answer is **unknown**. Despite serious efforts using different methods (Faber, Q. Yin, Randal-Williams) no relation **not** in \mathcal{I}_g^{FZ} has been found.

Our construction of the Faber-Zagier relations uses the moduli space of stable quotients which mixes ingredients of Grothendieck's Quot scheme and the Deligne-Mumford compactification

$$\mathcal{M}_g \subset \overline{\mathcal{M}}_g .$$

The geometry of the virtual class of the stable quotient moduli leads eventually to the relations.

- The proof establishes the Faber-Zagier relations in the Chow ring (algebraic cycles).

Question: Is \mathcal{I}_g^{FZ} the complete ideal of relations in $R^*(\mathcal{M}_g)$?

Answer: For $g \leq 23$, **yes**. For $g \geq 24$, the answer is **unknown**. Despite serious efforts using different methods (Faber, Q. Yin, Randal-Williams) no relation **not** in \mathcal{I}_g^{FZ} has been found.

Our construction of the Faber-Zagier relations uses the moduli space of stable quotients which mixes ingredients of Grothendieck's Quot scheme and the Deligne-Mumford compactification

$$\mathcal{M}_g \subset \overline{\mathcal{M}}_g .$$

The geometry of the virtual class of the stable quotient moduli leads eventually to the relations.

- The proof establishes the Faber-Zagier relations in the Chow ring (algebraic cycles).
- The proof yields the following stronger boundary result. Under the hypotheses of the Theorem,

$$\left[\exp(-\gamma^{FZ}) \right]_{trp^\sigma} \in R^*(\partial \overline{\mathcal{M}}_g) .$$

Not only is the Faber-Zagier relation 0 on $R^*(\mathcal{M}_g)$, but the relation is equal to a tautological class on the boundary of the moduli space $\overline{\mathcal{M}}_g$.

Not only is the **Faber-Zagier** relation 0 on $R^*(\mathcal{M}_g)$, but the relation is equal to a tautological class on the boundary of the moduli space $\overline{\mathcal{M}}_g$.

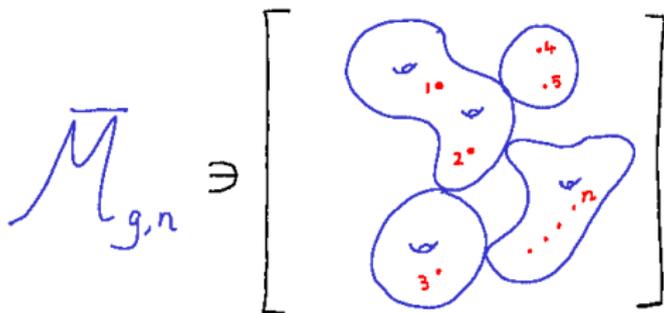

§V. Relations in the cohomology of $\overline{\mathcal{M}}_{g,n}$

Let $\overline{\mathcal{M}}_{g,n}$ be the moduli space of **stable** pointed curves:

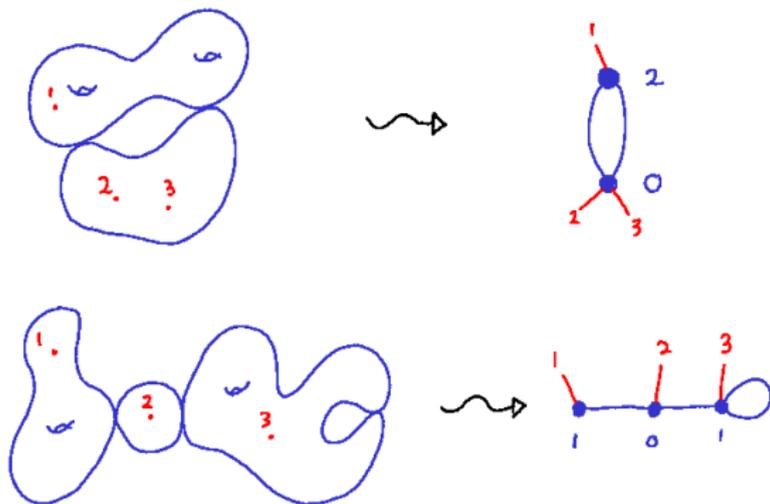

Not only is the **Faber-Zagier** relation 0 on $R^*(\mathcal{M}_g)$, but the relation is equal to a tautological class on the boundary of the moduli space $\overline{\mathcal{M}}_g$.

§V. Relations in the cohomology of $\overline{\mathcal{M}}_{g,n}$

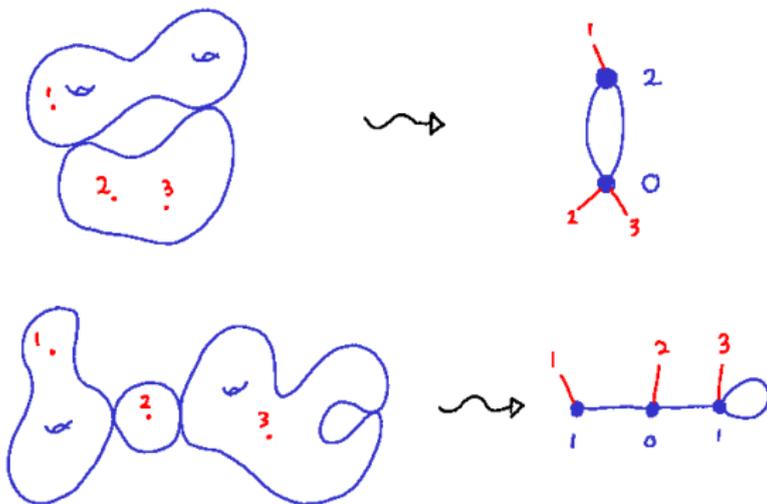

Let $\overline{\mathcal{M}}_{g,n}$ be the moduli space of **stable** pointed curves:

The boundary strata of the moduli $\overline{\mathcal{M}}_{g,n}$ of *fixed topological type* correspond to *stable graphs*.

The boundary strata of the moduli $\overline{\mathcal{M}}_{g,n}$ of *fixed topological type* correspond to *stable graphs*.

For such a graph Γ , let $[\Gamma] \in H^*(\overline{\mathcal{M}}_{g,n}, \mathbb{Q})$ denote the class of the closure (with a multiplicity related to symmetries of Γ).

Formally, a **stable graph** is the structure

$$\Gamma = (\mathbf{V}, \mathbf{E}, \mathbf{L}, g)$$

satisfying the following properties:

- \mathbf{V} is the **vertex** set with a genus function $g : \mathbf{V} \rightarrow \mathbb{Z}_{\geq 0}$,
- \mathbf{E} is the **edge** set,
- \mathbf{L} , the set of **legs** (corresponding to the set of markings),
- the pair (\mathbf{V}, \mathbf{E}) defines a **connected** graph,
- for each vertex v , the stability condition holds:

$$2g(v) - 2 + n(v) > 0,$$

where $n(v)$ is the valence of Γ at v including both edges and legs.

The genus of a stable graph Γ is defined by:

$$g(\Gamma) = \sum_{v \in \mathbf{V}} g(v) + h^1(\Gamma).$$

To each stable graph Γ , we associate the moduli space

$$\overline{\mathcal{M}}_\Gamma = \prod_{v \in V} \overline{\mathcal{M}}_{g(v), n(v)}.$$

There is a canonical morphism

$$\xi_\Gamma : \overline{\mathcal{M}}_\Gamma \rightarrow \overline{\mathcal{M}}_{g,n}, \quad \xi_{\Gamma*}[\overline{\mathcal{M}}_\Gamma] = [\Gamma].$$

To each stable graph Γ , we associate the moduli space

$$\overline{\mathcal{M}}_\Gamma = \prod_{v \in V} \overline{\mathcal{M}}_{g(v), n(v)}.$$

There is a canonical morphism

$$\xi_\Gamma : \overline{\mathcal{M}}_\Gamma \rightarrow \overline{\mathcal{M}}_{g,n}, \quad \xi_{\Gamma*}[\overline{\mathcal{M}}_\Gamma] = [\Gamma].$$

The first boundary relation is almost trivial:

The diagram shows two configurations of a graph with two vertices (blue dots) and four edges (red lines), enclosed in large square brackets. The left configuration has edges labeled 1, 2, 3, and 4. The right configuration has edges labeled 1, 2, 3, and 4. An equals sign is between the two brackets. To the right of the second bracket is the expression $\in \mathbb{H}^2(\overline{\mathcal{M}}_{0,4})$.

Just an equivalence of two points in $\overline{\mathcal{M}}_{0,4} = \mathbb{CP}^1$.

To each stable graph Γ , we associate the moduli space

$$\overline{\mathcal{M}}_\Gamma = \prod_{v \in V} \overline{\mathcal{M}}_{g(v), n(v)}.$$

There is a canonical morphism

$$\xi_\Gamma : \overline{\mathcal{M}}_\Gamma \rightarrow \overline{\mathcal{M}}_{g,n}, \quad \xi_{\Gamma*}[\overline{\mathcal{M}}_\Gamma] = [\Gamma].$$

The first boundary relation is almost trivial:

The diagram shows two configurations of a graph with two vertices and four edges, enclosed in large square brackets. The left configuration has edges labeled 1, 2, 3, and 4. The right configuration has edges labeled 1, 2, 3, and 4. An equals sign is between the two brackets. To the right of the second bracket is the expression $\in \mathbb{H}^2(\overline{\mathcal{M}}_{0,4})$.

Just an equivalence of two points in $\overline{\mathcal{M}}_{0,4} = \mathbb{CP}^1$.

Getzler in 1996 found the first really interesting relation:

$$\begin{aligned}
 & 12 \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \circ \end{array} \right] - 4 \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \circ \end{array} \right] - 2 \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \circ \end{array} \right] \\
 + 6 \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \circ \end{array} \right] + \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \circ \end{array} \right] + \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \circ \end{array} \right] - 2 \left[\begin{array}{c} \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Red } \vee \\ \text{Blue } \bullet \\ | \\ \text{Blue } \circ \end{array} \right] \\
 = 0 \in H^4(\bar{\mathcal{M}}_{1,4})
 \end{aligned}$$

Of course there are more, but relations are not easy to find. The next interesting relation ([Belorousski-P in 1998](#)) occurs in genus 2:

$$\begin{aligned}
 & -2 \left[\begin{array}{c} \text{Diagram 1} \\ \text{with } \psi \end{array} \right] + 2 \left[\begin{array}{c} \text{Diagram 2} \\ \text{with } \psi \end{array} \right] + 3 \left[\begin{array}{c} \text{Diagram 3} \\ \text{with } \psi \end{array} \right] - 3 \left[\begin{array}{c} \text{Diagram 4} \\ \text{with } \psi \end{array} \right] \\
 & + \frac{2}{5} \left[\begin{array}{c} \text{Diagram 5} \\ \text{with } \psi \end{array} \right] - \frac{6}{5} \left[\begin{array}{c} \text{Diagram 6} \\ \text{with } \psi \end{array} \right] + \frac{12}{5} \left[\begin{array}{c} \text{Diagram 7} \\ \text{with } \psi \end{array} \right] - \frac{18}{5} \left[\begin{array}{c} \text{Diagram 8} \\ \text{with } \psi \end{array} \right] - \frac{6}{5} \left[\begin{array}{c} \text{Diagram 9} \\ \text{with } \psi \end{array} \right] \\
 & + \frac{9}{5} \left[\begin{array}{c} \text{Diagram 10} \\ \text{with } \psi \end{array} \right] - \frac{6}{5} \left[\begin{array}{c} \text{Diagram 11} \\ \text{with } \psi \end{array} \right] + \frac{1}{60} \left[\begin{array}{c} \text{Diagram 12} \\ \text{with } \psi \end{array} \right] - \frac{3}{20} \left[\begin{array}{c} \text{Diagram 13} \\ \text{with } \psi \end{array} \right] + \frac{3}{20} \left[\begin{array}{c} \text{Diagram 14} \\ \text{with } \psi \end{array} \right] \\
 & - \frac{1}{60} \left[\begin{array}{c} \text{Diagram 15} \\ \text{with } \psi \end{array} \right] + \frac{1}{5} \left[\begin{array}{c} \text{Diagram 16} \\ \text{with } \psi \end{array} \right] - \frac{3}{5} \left[\begin{array}{c} \text{Diagram 17} \\ \text{with } \psi \end{array} \right] + \frac{1}{5} \left[\begin{array}{c} \text{Diagram 18} \\ \text{with } \psi \end{array} \right] - \frac{1}{10} \left[\begin{array}{c} \text{Diagram 19} \\ \text{with } \psi \end{array} \right] - \frac{1}{10} \left[\begin{array}{c} \text{Diagram 20} \\ \text{with } \psi \end{array} \right] = 0
 \end{aligned}$$

in $H^4(\overline{\mathcal{M}}_{2,3}, \mathbb{Q})$.

Of course there are more, but relations are not easy to find. The next interesting relation ([Belorousski-P in 1998](#)) occurs in genus 2:

$$\begin{aligned}
 & -2 \left[\begin{array}{c} \text{Diagram 1} \\ \text{1} \quad \text{2} \end{array} \right] + 2 \left[\begin{array}{c} \text{Diagram 2} \\ \text{1} \quad \text{2} \end{array} \right] + 3 \left[\begin{array}{c} \text{Diagram 3} \\ \text{1} \quad \text{2} \end{array} \right] - 3 \left[\begin{array}{c} \text{Diagram 4} \\ \text{1} \quad \text{2} \end{array} \right] \\

 \end{aligned}$$

in $H^4(\overline{\mathcal{M}}_{2,3}, \mathbb{Q})$.

Question: Is there any structure to these formulas?

Question: Is there any relationship to the [Faber-Zagier](#) relations?

§VI. Pixton's relations on $\overline{\mathcal{M}}_{g,n}$

§VI. Pixton's relations on $\overline{\mathcal{M}}_{g,n}$

We define tautological classes $\mathcal{R}_{g,A}^d$ associated to the data

- $g, n \in \mathbb{Z}_{\geq 0}$ in the stable range $2g - 2 + n > 0$,
- $A = (a_1, \dots, a_n)$, $a_i \in \{0, 1\}$,
- $d \in \mathbb{Z}_{\geq 0}$ satisfying $d > \frac{g-1+\sum_{i=1}^n a_i}{3}$.

The elements $\mathcal{R}_{g,A}^d$ are expressed as sums over **stable graphs** of genus g with n legs. Pixton's relations then take the form

$$\mathcal{R}_{g,A}^d = 0 \in H^{2d}(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}).$$

Before writing the formula for $\mathcal{R}_{g,A}^d$, a few definitions are required.

We have already seen the following two series:

$$B_0(T) = \sum_{m \geq 0} \frac{(6m)!}{(2m)!(3m)!} (-T)^m = 1 - 60T + 27720T^2 \dots ,$$

$$B_1(T) = \sum_{m \geq 0} \frac{1 + 6m}{1 - 6m} \frac{(6m)!}{(2m)!(3m)!} (-T)^m = 1 + 84T - 32760T^2 \dots .$$

These series control the original set of [Faber-Zagier](#) relations and continue to play a central role [Pixton's](#) relations.

Let $f(T)$ be a power series with vanishing constant and linear terms,

$$f(T) \in T^2\mathbb{Q}[[T]] .$$

For each $\overline{\mathcal{M}}_{g,n}$, we define

$$\kappa(f) = \sum_{m \geq 0} \frac{1}{m!} \pi_{m*} \left(f(\psi_{n+1}) \cdots f(\psi_{n+m}) \right) \in H^*(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}),$$

where $\pi_m : \overline{\mathcal{M}}_{g,n+m} \rightarrow \overline{\mathcal{M}}_{g,n}$ is the forgetful map. By the vanishing in degrees 0 and 1 of f , the sum is **finite**.

Let $f(T)$ be a power series with vanishing constant and linear terms,

$$f(T) \in T^2\mathbb{Q}[[T]] .$$

For each $\overline{\mathcal{M}}_{g,n}$, we define

$$\kappa(f) = \sum_{m \geq 0} \frac{1}{m!} \pi_{m*} \left(f(\psi_{n+1}) \cdots f(\psi_{n+m}) \right) \in H^*(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}),$$

where $\pi_m : \overline{\mathcal{M}}_{g,n+m} \rightarrow \overline{\mathcal{M}}_{g,n}$ is the forgetful map. By the vanishing in degrees 0 and 1 of f , the sum is **finite**.

Let $G_{g,n}$ be the **finite** set of **stable graphs** of genus g with n legs (up to isomorphism).

Let $f(T)$ be a power series with vanishing constant and linear terms,

$$f(T) \in T^2\mathbb{Q}[[T]] .$$

For each $\overline{\mathcal{M}}_{g,n}$, we define

$$\kappa(f) = \sum_{m \geq 0} \frac{1}{m!} \pi_{m*} \left(f(\psi_{n+1}) \cdots f(\psi_{n+m}) \right) \in H^*(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}),$$

where $\pi_m : \overline{\mathcal{M}}_{g,n+m} \rightarrow \overline{\mathcal{M}}_{g,n}$ is the forgetful map. By the vanishing in degrees 0 and 1 of f , the sum is **finite**.

Let $G_{g,n}$ be the **finite** set of **stable graphs** of genus g with n legs (up to isomorphism).

For each vertex $v \in V$ of a **stable graph**, we introduce an auxiliary variable ζ_v and impose the conditions

$$\zeta_v \zeta_{v'} = \zeta_{v'} \zeta_v , \quad \zeta_v^2 = 1 .$$

The variables ζ_v will be responsible for keeping track of a local parity condition at each **vertex**.

The formula for $\mathcal{R}_{g,A}^d$ is a sum over $G_{g,n}$. The summand corresponding to $\Gamma \in G_{g,n}$ is a product of vertex, leg, and edge factors:

The formula for $\mathcal{R}_{g,A}^d$ is a sum over $G_{g,n}$. The summand corresponding to $\Gamma \in G_{g,n}$ is a product of **vertex**, **leg**, and **edge** factors:

- For $v \in V$, let $\kappa_v = \kappa(T - TB_0(\zeta_v T))$.

The formula for $\mathcal{R}_{g,A}^d$ is a sum over $G_{g,n}$. The summand corresponding to $\Gamma \in G_{g,n}$ is a product of **vertex**, **leg**, and **edge** factors:

- For $v \in V$, let $\kappa_v = \kappa(T - TB_0(\zeta_v T))$.
- For $\ell \in L$, let $B_\ell = \zeta_{v(\ell)}^{a_\ell} B_{a_\ell}(\zeta_{v(\ell)} \psi_\ell)$, where $v(\ell) \in V$ is the **vertex** to which the leg is assigned.

The formula for $\mathcal{R}_{g,A}^d$ is a sum over $G_{g,n}$. The summand corresponding to $\Gamma \in G_{g,n}$ is a product of **vertex**, **leg**, and **edge** factors:

- For $v \in V$, let $\kappa_v = \kappa(T - TB_0(\zeta_v T))$.
- For $\ell \in L$, let $B_\ell = \zeta_{v(\ell)}^{a_\ell} B_{a_\ell}(\zeta_{v(\ell)} \psi_\ell)$, where $v(\ell) \in V$ is the **vertex** to which the leg is assigned.
- For $e \in E$, let

$$\begin{aligned} \Delta_e &= \frac{\zeta' + \zeta'' - B_0(\zeta' \psi') \zeta'' B_1(\zeta'' \psi'') - \zeta' B_1(\zeta' \psi') B_0(\zeta'' \psi'')}{\psi' + \psi''} \\ &= (60\zeta' \zeta'' - 84) + [32760(\zeta' \psi' + \zeta'' \psi'') - 27720(\zeta' \psi'' + \zeta'' \psi')] \cdots, \end{aligned}$$

where ζ', ζ'' are the ζ -variables assigned to the **vertices** adjacent to the **edge** e and ψ', ψ'' are the ψ -classes corresponding to the **half-edges**.

The numerator of Δ_e is divisible by the denominator due to the identity (discovered by Pixton)

$$B_0(T)B_1(-T) + B_0(-T)B_1(T) = 2.$$

Obviously Δ_e is symmetric in the half-edges.

The numerator of Δ_e is divisible by the denominator due to the identity (discovered by Pixton)

$$B_0(T)B_1(-T) + B_0(-T)B_1(T) = 2.$$

Obviously Δ_e is symmetric in the half-edges.

Definition (Pixton 2012)

Let $A = (a_1, \dots, a_n) \in \{0, 1\}^n$. We denote by $R_{g,A}^d \in H^{2d}(\overline{\mathcal{M}}_{g,n})$ the degree d component of the class

$$\sum_{\Gamma \in \mathcal{G}_{g,n}} \frac{1}{|\text{Aut}(\Gamma)|} \frac{1}{2^{h^1(\Gamma)}} \left[\Gamma, \left[\prod \kappa_v \prod B_\ell \prod \Delta_e \right]_{\prod_v \zeta_v^{g(v)-1}} \right],$$

where the products are taken over all vertices, all legs, and all edges of the graph Γ .

The subscript $\prod_v \zeta_v^{g(v)-1}$ indicates the coefficient of the monomial $\prod_v \zeta_v^{g(v)-1}$ after the product inside the brackets is expanded.

Theorem (P.-Pixton-Zvonkine 2013)

For $2g - 2 + n > 0$, $a_i \in \{0, 1\}$, and $d > \frac{g-1+\sum_{i=1}^n a_i}{3}$, Pixton's relations hold

$$R_{g,A}^d = 0 \in H^{2d}(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}).$$

Theorem (P.-Pixton-Zvonkine 2013)

For $2g - 2 + n > 0$, $a_i \in \{0, 1\}$, and $d > \frac{g-1+\sum_{i=1}^n a_i}{3}$, Pixton's relations hold

$$R_{g,A}^d = 0 \in H^{2d}(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}).$$

Proof uses the Givental-Teleman classification of higher genus structures associated to the semi-simple Frobenius manifold A_2 (related to 3-spin curves). After restriction, we obtain a new proof of the Faber-Zagier relations in $R^*(\mathcal{M}_g)$.

Theorem (P.-Pixton-Zvonkine 2013)

For $2g - 2 + n > 0$, $a_i \in \{0, 1\}$, and $d > \frac{g-1+\sum_{i=1}^n a_i}{3}$, Pixton's relations hold

$$R_{g,A}^d = 0 \in H^{2d}(\overline{\mathcal{M}}_{g,n}, \mathbb{Q}).$$

Proof uses the Givental-Teleman classification of higher genus structures associated to the semi-simple Frobenius manifold A_2 (related to 3-spin curves). After restriction, we obtain a new proof of the Faber-Zagier relations in $R^*(\mathcal{M}_g)$.

A second proof of Pixton's relations in Chow has been found by Felix Janda using the stable quotient approach.

Theorem (P.-Pixton-Zvonkine 2013)

For $2g - 2 + n > 0$, $a_i \in \{0, 1\}$, and $d > \frac{g-1+\sum_{i=1}^n a_i}{3}$, Pixton's relations hold
